# ABSTRACT

A displacement solution for the calculation of structural influence coefficients (SIC's) is presented. The formulation utilizes the lumped parameter approach that is consistent with collocation flutter solutions. The structure is synthesized as concentrated mass elements connected by massless elastic plates and/or beams. There are two methods of generating the mass matrix; they are: 1) lumped concentrated mass points, 2) consistent mass matrices. Along with the calculation of the SIC's, the natural vibration modes and frequencies are calculated. There are two options for punching out the flexibility matrix for use in subsequent COFA computer programs. Option 1, punches out the full flexibility matrix; Option 2, punches out the reduced flexibility matrix eliminating the rows and columns pertaining to structural attach points.

## 1.0 INTRODUCTION

In order to determine the aeroelastic behavior of a wing or control surface, it is necessary to know the aerodynamics, elastic properties and mass distributions of the structure. The overall aeroelastic analysis is usually divided into four separate parts as shown in Figure 1.

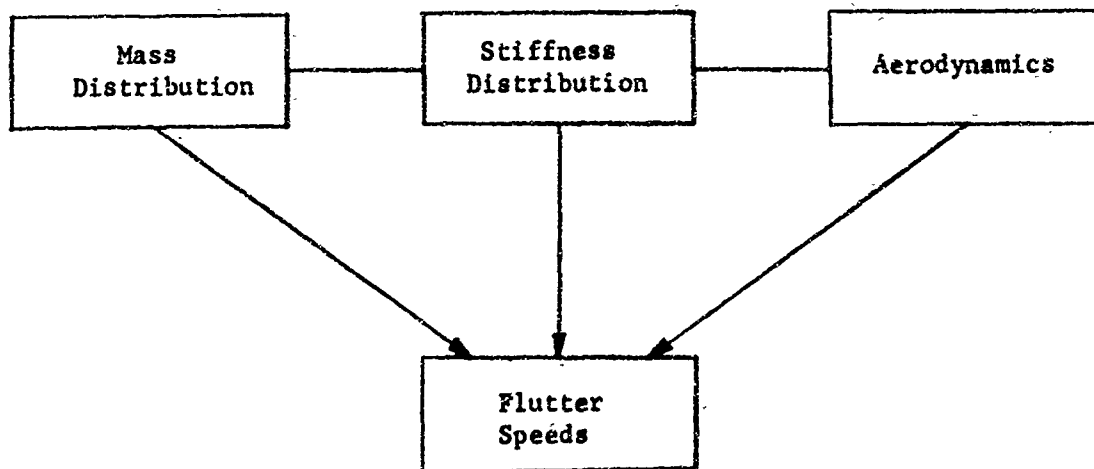

Figure 1. Analysis Procedure

This portion of the report describes the computation of the mass and stiffness distribution. The geometry of a wing or tail surface is too complex for the successful use of closed form analytical techniques. Therefore, a numerical type of analysis must be used. The end product of this analysis is the generation of overall influence coefficient and mass matrices referred to a set of node points arbitrarily picked on the surface of the structure. The finite element method (see Refs. 2 and 3) was used to form the required matrices for a planar structure. This technique is especially suited to solve complex structures and as used in the analysis is general enough to handle the following:

1. Combinations of beam and plate elements
2. Arbitrary boundary conditions
3. Lumped or distributed stiffnesses and masses

A discussion of the theory and computer program which calculates the influence coefficient and the mass matrix as well as the structural modes and frequencies is given in the following sections.

## 2.0 NOMENCLATURE

C	=	Unknown Boundary Constants
D	=	Plate Rigidity Constant
E	=	Modulus of Elasticity
F	=	Force
K	=	Stiffness Coefficients
M	=	Bending/Torsional Moment
p	=	Pressure
T	=	Coordinate Transformation
t	=	Thickness
w	=	Linear Displacement in z direction
x, y, z	=	Coordinate Axes
s	=	Linear Displacement
$\frac{d^2}{dc^2}$	=	Curvature
$\rho$	=	Density
$\sigma$	=	Stress
$\nu$	=	Poisson's Ratio
$\frac{\partial}{\partial c}$	=	Partial Derivative
[ ]	=	Square Matrix
{ }	=	Column Matrix
[ ]	=	Row Matrix

### 3.0 TECHNICAL DISCUSSION

#### 3.1 Influence Coefficients

The stiffness method approach is first used to obtain an overall stiffness matrix of the structure. This matrix is reduced by partitioning and then inverted to obtain the influence coefficients at any desired set of control points. The number of control points are denoted by N. At each node, three degrees of freedom are specified: two rotations and the normal displacement. Therefore, a stiffness matrix of approximately 3N degrees of freedom is first formed by superimposing individual plate and plane grid beam element global coordinate matrices. The matrix will be somewhat smaller than 3N degrees of freedom since boundary restraint conditions will reduce the size of the matrix. To illustrate the matrix condensation method used in the computer program, we will assume that we have N control point normal displacements and M displacements which must be eliminated. The overall stiffness matrix is given as

$$[K] = \begin{bmatrix} K_{NN} & K_{NM} \\ K_{MN} & K_{MM} \end{bmatrix} \quad (1)$$

The structural equilibrium matrix equation can be written as

$$\begin{bmatrix} K_{NN} & K_{NM} \\ K_{MN} & K_{MM} \end{bmatrix} \begin{Bmatrix} \delta_N \\ \delta_M \end{Bmatrix} = \begin{Bmatrix} F_N \\ F_M \end{Bmatrix} \quad (2)$$

We now assume that forces at the points to be eliminated are small and can be neglected. Therefore,

$$\begin{bmatrix} K_{NN} & K_{NM} \\ K_{MN} & K_{MM} \end{bmatrix} \begin{Bmatrix} \delta_N \\ \delta_M \end{Bmatrix} = \begin{Bmatrix} F_N \\ 0 \end{Bmatrix} \quad (3)$$

or

$$[K_{NN}]\{\delta_N\} + [K_{NM}]\{\delta_M\} = \{F_N\}$$

and

$$[K_{MN}]\{\delta_N\} + [K_{MM}]\{\delta_M\} = \{0\}$$

Therefore

$$\{\delta_M\} = -[K_{MM}]^{-1} [K_{MN}]\{\delta_N\} \quad (3a)$$

and

$$\left( [K_{NN}] - [K_{NM}][K_{MM}]^{-1}[K_{MN}] \right) \{\delta_N\} = \{F_N\}$$

and since

$$[K_{MN}]^T = [K_{NM}]$$

we have

$$\{\delta_N\} = \left( [K_{NN}] - [K_{MN}]^T [K_{MM}]^{-1} [K_{MN}] \right)^{-1} \{F_N\}$$

If we now let

$$[f_{NN}] = \left( [K_{NN}] - [K_{MN}]^T [K_{MM}]^{-1} [K_{MN}] \right)^{-1}$$

then Equation (4) can be written as

$$\{\delta_N\} = [f_{NN}] \{F_N\} \quad (5)$$

The matrix  $[f_{NN}]$  is called the structural influence coefficient matrix. The application of loads at the control points yield displacements at the control points by carrying out the matrix multiplication indicated in Equation (5).

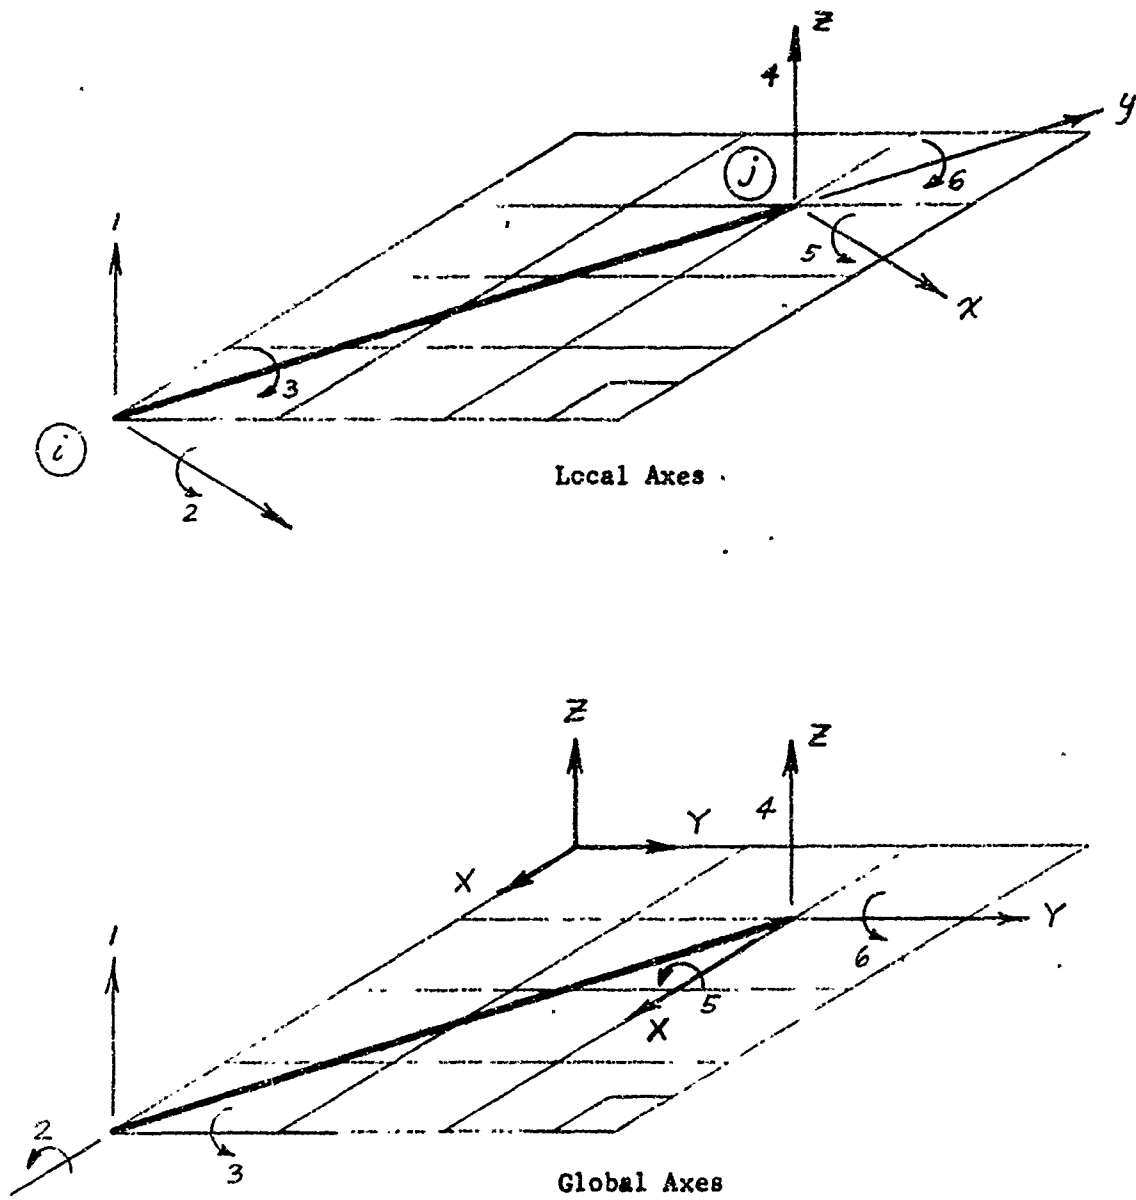

Figure 2. Plane Grid Beam Local and Global Coordinate System

The computer program FLUENC carries out the required operations to obtain the influence coefficient matrix  $[f_{NN}]$ . A detailed description of the program can be found in Section 4.0. The program is written to form a 50 x 50 influence coefficient matrix. The influence coefficient matrix is punched out on cards in a format compatible with the Collocation Flutter Program.

The plane grid beam global coordinate stiffness matrix used in the program was obtained from Reference 1 and is given in Table 1. The local and global coordinate systems are shown in Figure 2. The figure also contains the sign convention for the six degrees of freedom for each element.

The triangular plate stiffness matrix given in Reference 2 was used in the computer program. The plate element can be materially or geometrically orthotropic as treated in Reference 3. Stiffened plates can be considered to be geometrically orthotropic. The sign convention and nodal degrees of freedom are shown in Figure 3.

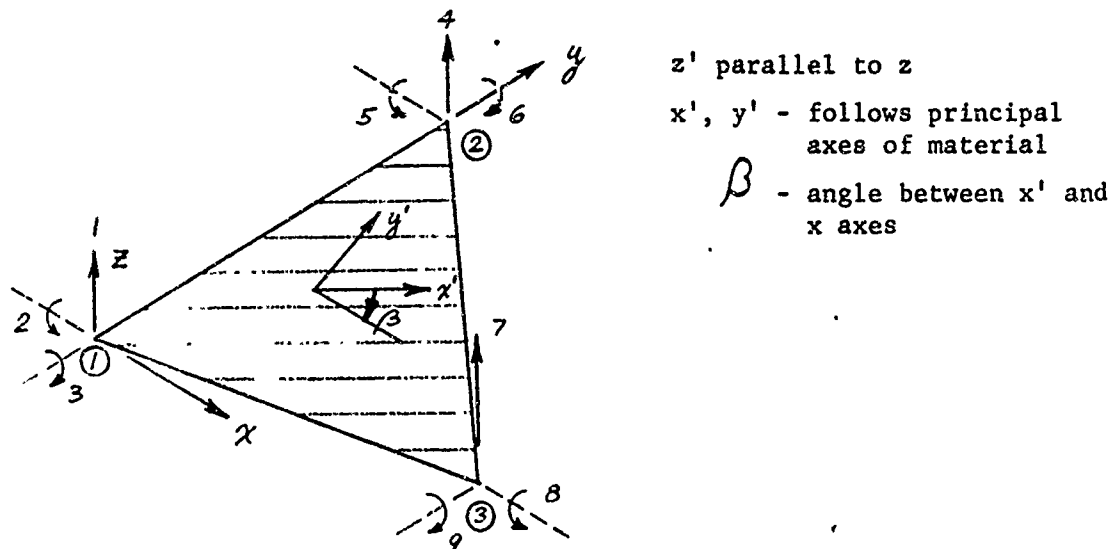

Figure 3. Orthotropic Triangular Element

Following the analysis given in Reference 2, the deflection shape of the plate element is assumed to be of the form

$$w = C_1 + C_2 x + C_3 y + C_4 x^2 + C_5 xy + C_6 y^2 + C_7 x^3 + C_8 (xy^2 + x^2y) + C_9 y^3$$

or

$$w = [N] \{C\} \quad (6)$$

The unknown constants  $C_1, C_2, \dots, C_9$  can be written in terms of the nodal displacements  $\delta_1, \delta_2, \dots, \delta_9$  by using the boundary conditions

$$\begin{aligned} \text{at } x=0, y=0 & \quad \begin{cases} w = \delta_1 \\ \partial w / \partial y = \delta_2 \\ \partial w / \partial x = -\delta_3 \end{cases} \\ \text{at } x=0, y=y_2 & \quad \begin{cases} w = \delta_4 \\ \partial w / \partial y = \delta_5 \\ \partial w / \partial x = -\delta_6 \end{cases} \\ \text{at } x=x_3, y=y_3 & \quad \begin{cases} w = \delta_7 \\ \partial w / \partial y = \delta_8 \\ \partial w / \partial x = -\delta_9 \end{cases} \end{aligned} \quad (7)$$

Using Equation (6) in conjunction with the boundary conditions given by Equation (7) yields

$$\begin{Bmatrix} \delta_1 \\ \delta_2 \\ \delta_3 \\ \delta_4 \\ \delta_5 \\ \delta_6 \\ \delta_7 \\ \delta_8 \\ \delta_9 \end{Bmatrix} = [N] \begin{Bmatrix} C_1 \\ C_2 \\ C_3 \\ C_4 \\ C_5 \\ C_6 \\ C_7 \\ C_8 \\ C_9 \end{Bmatrix} \quad (8)$$

where  $C =$

$$\begin{bmatrix} 1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & 0 & 1 & 0 & 0 & 0 & 0 & 0 & 0 \\ 0 & -1 & 0 & 0 & 0 & 0 & 0 & 0 & 0 \\ 1 & 0 & y_2 & 0 & 0 & y_2^2 & 0 & 0 & y_2^3 \\ 0 & 0 & 1 & 0 & 0 & 2y_2 & 0 & 0 & 3y_2^2 \\ 0 & -1 & 0 & 0 & -y_2 & 0 & 0 & -y_2^2 & 0 \\ 1 & x_3 & y_3 & x_3^2 & x_3 y_3 & y_3^2 & x_3^3 & x_3 y_3^2 + x_3^2 y_3 & y_3^3 \\ 0 & 0 & 1 & 0 & x_3 & 2y_3 & 0 & 2x_3 y_3 + x_3^2 & 3y_3^2 \\ 0 & -1 & 0 & -2x_3 & -y_3 & 0 & -3x_3^2 & -(y_3^2 + 2x_3 y_3) & 0 \end{bmatrix}$$

The constant vector  $\{c\}$  can be obtained in terms of the nodal displacements by inverting the matrix  $[C]$ . Therefore,

$$\{c\} = [C]^{-1} \{\delta\} \quad (9)$$

The curvatures for a flat plate element are given by

$$\{\epsilon\} = \begin{Bmatrix} \epsilon_x \\ \epsilon_y \\ \epsilon_{xy} \end{Bmatrix} = - \begin{Bmatrix} \partial^2 w / \partial x^2 \\ \partial^2 w / \partial y^2 \\ 2 \partial^2 w / \partial x \partial y \end{Bmatrix} \quad (10)$$

Substituting Equation (6) into Equation (10) yields

$$\{\epsilon\} = [Q] \{c\} \quad (11)$$

where

$$[Q] = \begin{bmatrix} 0 & 0 & 0 & -2 & 0 & 0 & -4x & -2y & 0 \\ 0 & 0 & 0 & 0 & 0 & -2 & 0 & -2x & -6y \\ 0 & 0 & 0 & 0 & -2 & 0 & 0 & -(4x+4y) & 0 \end{bmatrix}$$

Substituting Equation (9) into Equation (11) yields

$$\{\epsilon\} = [Q] [C]^{-1} \{\delta\} = [B] \{\delta\} \quad (12)$$

If initial strains are neglected then the moment-curvature relationships can be written in the form

$$\{\sigma\} = \begin{Bmatrix} M_x \\ M_y \\ M_{xy} \end{Bmatrix} = [D] \{\epsilon\} \quad (13)$$

where

$$[D] = \begin{bmatrix} D_x & D_1 & 0 \\ D_1 & D_y & 0 \\ 0 & 0 & D_{xy} \end{bmatrix} \quad (14)$$

for a materially or geometrically orthotropic plate. For an isotropic plate Equation (14) reduces to

$$[D] = \frac{Et^3}{12(1-\nu^2)} \begin{bmatrix} 1 & \nu & 0 \\ \nu & 1 & 0 \\ 0 & 0 & \frac{1-\nu}{2} \end{bmatrix} \quad (15)$$

The  $[D]$  matrix must undergo a transformation if the principal axes of the material do not coincide with the local coordinate axes. The components of strain in one coordinate axes system are related to the components of strain in another coordinate axes system by the matrix equation

$$\{\epsilon'\} = [T]^T \{\epsilon\} \quad (16)$$

(The prime refers to the components of strain referred to the  $x'-y'$  axes in Figure 3)

where

$$[T]^T = \begin{bmatrix} \cos^2 \beta & \sin^2 \beta & -2 \sin \beta \cos \beta \\ \sin^2 \beta & \cos^2 \beta & 2 \sin \beta \cos \beta \\ \sin \beta \cos \beta & \sin \beta \cos \beta & \cos^2 \beta - \sin^2 \beta \end{bmatrix} \quad (17)$$

Since the internal work is constant no matter which coordinate system is used

$$\{\sigma'\}^T \{\epsilon'\} = \{\sigma\}^T \{\epsilon\} \quad (18)$$

or by Equation (13)

$$\{\epsilon'\}^T [D'] \{\epsilon'\} = \{\epsilon\}^T [D] \{\epsilon\}$$

and by using Equation (16)

$$\{\epsilon\}^T [\tau] [D'] [\tau]^T \{\epsilon\} = \{\epsilon\}^T [D] \{\epsilon\}$$

Therefore

$$[D] = [\tau] [D'] [\tau]^T \quad (19)$$

The stiffness matrix for a typical element ① ② ③ is given by

$$[K] = \iint_A [B]^T [D] [B] dx dy \quad (20)$$

or by Equations (12) and (19)

$$[K] = [C^{-1}]^T \left( \iint_A [Q]^T [\tau] [D'] [\tau]^T [Q] dx dy \right) [C]^{-1} \quad (21)$$

Now let

$$[\bar{D}] = \iint_A [Q]^T [\tau] [D'] [\tau]^T [Q] dx dy$$

and carrying out the indicated matrix multiplications yields

$$[\bar{D}] = \iint_A (\text{see Table 1}) dx dy \quad (22)$$

In order to simplify the integration required for evaluating the matrix in Equation (22), it is suggested in Reference 2 that the independent variables be changed as shown in Figure 4.

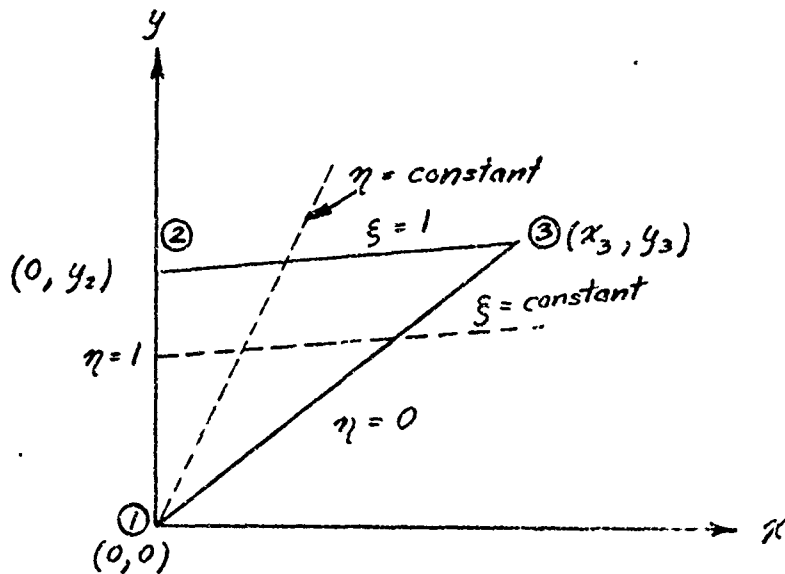

Figure 4  
Coordinate Transformation

The relationships

$$\begin{aligned} x &= \xi (1 - \eta) x_3 \\ y &= \xi [(1 - \eta) y_3 + \eta y_2] \end{aligned} \quad (23)$$

are used for the change of variables. The terms in Equation (22) can now be evaluated by using the relationship

$$I(x^m, y^n) = \iint x^m y^n dx dy$$

or

$$I(x^m, y^n) = \iint x^m y^n |J(x, y)| d\xi d\eta \quad (24)$$

where

$$J(x, y) = \begin{vmatrix} \frac{\partial x}{\partial \xi} & \frac{\partial x}{\partial \eta} \\ \frac{\partial y}{\partial \xi} & \frac{\partial y}{\partial \eta} \end{vmatrix} \quad (25)$$

Substituting Equation (23) into Equation (25) yields

$$J(x, y) = \xi x_3 y_2 \quad (26)$$

Substituting Equations (23) and (26) into Equation (24) yields

$$I(x^m, y^n) = \int_0^1 \int_0^1 \xi^{m+n+1} (1-\eta)^m [(1-\eta)y_3 + \eta y_2]^n x_3^{m+1} y_2 d\xi d\eta \quad (27)$$

which can easily be evaluated for any m and n.

### 3.2 Mass Matrix

D'Alembert's principle can be used for the formulation of the mass matrix. If masses are attached to the nodes of the structure, then the nodal dynamic forces are

$$\{P\} = -[M] \frac{d^2\{\delta\}}{dt^2} \quad (28)$$

where

$$[M] = \begin{bmatrix} M_1 & & 0 \\ & M_2 & \\ 0 & & \ddots \\ & & & M_n \end{bmatrix} \quad (29)$$

is a diagonal matrix. The mass of beam and plate elements are usually distributed throughout the structure. Therefore, the distributed pressure loading can be written in the form

$$p = -\rho \frac{d^2 w}{dt^2} \quad (30)$$

Substituting Equations (6) and (9) into Equation (30) yields

$$p = -\rho [N][C]^{-1} \{\ddot{\delta}\}$$

or

$$p = -\rho [R] \{\ddot{\delta}\} \quad (31)$$

where

$$[R] = [N][C]^{-1}$$

Since the equivalent element nodal forces can be computed from the equation

$$\{P\}^e = - \int_V [R]^T p dV \quad (32)$$

then

$$\{P\}^e = \left\{ \int_V [R]^T [R] \rho dV \right\} \{\ddot{\delta}\} \quad (33)$$

Therefore the elemental consistent mass matrix is given by

$$[m]^e = \int [R]^T [R] \rho dV \quad (34)$$

The consistent mass matrices given in Reference 2 (see Tables 3 and 4) are used in the computer program.

Once the elemental consistent mass and/or lumped mass matrices are computed, then the overall matrix is obtained by following the same technique as used in assembling the overall stiffness matrix.

The overall mass matrix is reduced by using Equation (3a). We again assume that we have N control point normal displacements and M displacements which must be eliminated. The overall mass matrix can be written in the form

$$[M] = \begin{bmatrix} M_{NN} & M_{NM} \\ M_{MN} & M_{MM} \end{bmatrix} \quad (35)$$

and the displacements

$$\{\delta\} = \begin{Bmatrix} \delta_N \\ \delta_M \end{Bmatrix} \quad (36)$$

From Equation (3a) we have

$$\{\delta_M\} = -[K_{MM}]^{-1}[K_{MN}]\{\delta_N\} \quad (3a)$$

Since the virtual work of the reduced mass system must equal the virtual work of the true mass system

$$-\{\Delta\delta_N\}^T[M_r]\{\ddot{\delta}_N\} = -\{\Delta\delta\}^T[M]\{\ddot{\delta}\} \quad (37)$$

where

$\{\Delta\delta_N\}$  = virtual displacements of control points

$\{\Delta\delta\}$  = virtual displacements of complete system

$[M_r]$  = overall reduced mass matrix

Equation (37) can be rewritten in the form

$$\{\Delta\delta_N\}^T[M_r]\{\ddot{\delta}_N\} = [\Delta\delta_N^T \quad \Delta\delta_M^T][M]\begin{Bmatrix} \delta_N \\ \delta_M \end{Bmatrix} \quad (38)$$

Substituting Equation (3a) into Equation (38) yields

$$\{\Delta\delta_N\}^T[M_r]\{\ddot{\delta}_N\} = \{\Delta\delta_N\}^T \left[ I \quad -[K_{NM}][K_{MM}]^{-1} \right] [M] \begin{bmatrix} I \\ -[K_{MM}]^{-1}[K_{MN}] \end{bmatrix} \{\ddot{\delta}_N\}$$

which yields the result

$$[M_r] = \begin{bmatrix} I & -[K_{NM}][K_{MM}]^{-1} \end{bmatrix} [M] \begin{bmatrix} I \\ [K_{MM}]^{-1}[K_{MN}] \end{bmatrix} \quad (39)$$

The reduced mass matrix given by Equation (39) is calculated in the computer program.

### 3.3 Modes and Frequencies

Since the design engineer may find it useful to know the mode shapes and natural frequencies of the structure, this information can be obtained by using the NMØDE option in the computer program. If no external forces are present then the reduced mass and influence coefficient matrices are related to one another by the relationship

$$[f_{NN}]^{-1} \{ \delta_N \} = - [M_r] \{ \ddot{\delta}_N \} \quad (40)$$

For determining natural frequencies, the deflections  $\{ \delta_N \}$  can be written as

$$\{ \delta_N \} = \{ \delta_o \} \sin \omega t \quad (41)$$

Substituting Equation (41) into Equation (40) yields

$$[f_{NN}]^{-1} \{ \delta_o \} = \omega^2 [M_r] \{ \delta_o \} \quad (42)$$

The solution of Equation (42) yields the natural frequencies,  $\omega$ , and the mode shapes  $\{ \delta_o \}$ . Since  $[f_{NN}]^{-1}$  and  $[M_r]$  are both symmetrical matrices, the mass matrix  $[M_r]$  can be triangularized

$$[M_r] = [L] [L]^T \quad (43)$$

where

$$[L] = \begin{bmatrix} l_{11} & 0 & 0 & \dots & 0 \\ l_{21} & l_{22} & 0 & \dots & 0 \\ \vdots & \vdots & l_{33} & \dots & \vdots \\ l_{n1} & \dots & \dots & \dots & l_{nn} \end{bmatrix}$$

Substituting Equation (43) into Equation (42) yields

$$[f_{NN}]^{-1} \{ \delta_o \} = \omega^2 [L] [L]^T \{ \delta_o \}$$

$$[L]^{-1} [f_{NN}]^{-1} \{\delta_o\} = \omega^2 [L]^T \{\delta_o\} \quad (44)$$

Since

$$[L^T]^{-1} [L^T] = [I]$$

Equation (44) may be written

$$[L]^{-1} [f_{NN}]^{-1} [L^T]^{-1} [L]^T \{\delta_o\} = \omega^2 [L]^T \{\delta_o\} \quad (44a)$$

or

$$[A] \{\bar{\delta}_o\} = \omega^2 \{\delta_o\} \quad (45)$$

where

$$[A] = [L]^{-1} [f_{NN}]^{-1} [L^T]^{-1}$$

$$\{\bar{\delta}_o\} = [L]^T \{\delta_o\}$$

An eigenvalue subroutine using the Givens method was used in the computer program package to solve Equation (45). The Givens method is fully described in Reference 4.

Note that the dynamical matrix  $[A]$  in the form described above is real and symmetric which is required by the Givens method. Conveniently,  $[L]$  and  $[L^T]$  are in triangular form which is used in the computer program package to save core storage space.

#### 4.0 PROGRAM DESCRIPTION

Computer program FLUENC written in FORTRAN IV carries out the operations set forth in Section 3.0 for generating the structural influence coefficients and mass matrices required by the Collocation Flutter Program. Briefly, the structure is assumed to be representable by a planar network of beams and triangular plate elements connected at discrete joints. At each joint, if there are no restraints, the program assumes three degrees of freedom; that is, one displacement normal to the plane of the structure and two rotations. The program first synthesizes the stiffness and mass matrices for the entire structure including all degrees of freedom from the data input for the beam and triangular plate elements and from the restraint information input for the joints. It then reduces the stiffness and mass matrices by eliminating all the rotational degrees of freedom and leaving only the normal displacements. As a final step, the program inverts the reduced stiffness matrix to obtain the influence coefficients.

Other features of the program include the option to compute lumped masses or to compute the consistent mass matrices for the beam and triangular plate elements or both. Also, the triangular plate elements may have either isotropic or orthotropic properties. There is an additional option to expand the reduced frequency matrix to include the degrees of freedom representing the restraint joint (one joint on a movable surface; two joints on a fixed component). This is accomplished by adding one or two zero rows and columns to the reduced flexibility matrix corresponding to the mass numbers of the attach points involved.

In the sections that follow detailed instructions are given for the preparation of input data and a description is given of the output illustrated with several sample problems. Also included are listings and flow charts of the program and a discussion of the processing requirements.

##### 4.1 Description of Program Input

The following instructions describe the input data, their physical units, and the FORTRAN format they must be punched with. The input quantities' names, all in capitals, are their FORTRAN names and, for reference, their equivalent names in Section 3.0 are listed in Appendix D.

##### 4.1.1 Title Card, format (12A6)

Two cards; any alphanumeric statement in columns 1 to 72.

#### 4.1.2 Problem Size and Control Information, format (7I5)

Column	1 - 5	6 - 10	11 - 15	16 - 20	21 - 25	26 - 30	31 -
Name	NJTS	NR	NBE	NPE	NMØDE	MKEY	NLUMP

NJTS = number of joints in structure (50 maximum)  
 NR = number of joints with one or more restraints  
 NBE = number of beam elements in structure  
 NPE = number of triangular plate elements in structure  
 NMØDE = number of eigenvalues and eigenvectors desired (9 maximum)  
 MKEY = 1. do not compute consistent mass terms for beam and/or triangular plate elements  
       = 2. compute consistent mass terms for beam and/or triangular plate elements  
 NLUMP = number of lumped masses input. Only lumped masses corresponding to the normal displacement at each joint may be input.

#### 4.1.3 Material Properties

##### (a) Number of Materials, format (I5)

Column	1 - 5
Name	NMAT

NMAT = number of materials for which properties are input (10 max.)

##### (b) Properties, format (4E10.3)

Input NMAT number of cards, one for each material.

Column	1 - 10	11 - 20	21 - 30	31 - 40
Name	YM(1)	PR(1)	GE(1)	DENS(1)

YM(i) = Young's modulus of elasticity divided by  $10^6$ ; psi  
 PR(i) = Poisson's ratio  
 GE(i) = modulus of rigidity; psi. If input as 0, it will be computed from the following formula:

$$GE(i) = \frac{YM(i)}{2 [1 + PR(i)]}$$

DENS(i) = material density; lb/in<sup>3</sup>. Not required if MKEY = 1

#### 4.1.4 Joint Coordinate Cards, format (10X, 2E10.3)

Input NJTS number of cards, one for each joint. Also, the structure is assumed to lie in the x-y plane.

Column	1 - 10	11 - 20	21 - 30
Name	m	X(m)	Y(m)

m = joint number (must be input consecutively starting with 1).  
May be placed anywhere between columns 1 and 10

X(m) = x coordinate of joint m; inches

Y(m) = y coordinate of joint m; inches

#### 4.1.5 Joint Restraint Information, format (4I5)

Input NR number of cards, one for each joint with one or more restraints.

Column	1 - 5	6 - 10	11 - 15	16 - 20
Name	JT	M1	M2	M3

JT = number of joint having one or more restraints

M1 = 0 free in the z direction

= 1 fixed in the z direction

M2 = 0 free to rotate about the x axis

= 1 fixed about the x axis

M3 = 0 free to rotate about the y axis

= 1 fixed about the y axis

#### 4.1.6 Lumped Masses, format (I5, 5X, E10.3)

Input NLUMP number of cards, one for each lumped mass.

Column	1 - 5	6 - 10	11 - 20
Name	JMASS	blank	RSMASS

JMASS = number of joint for which lumped mass is input

RSMASS = lumped mass, lb.

If more than one lumped mass is input for a particular joint, the program will sum the masses.

#### 4.1.7 Beam Element Properties, format (3E10.3, 3I5)

Input NBE number of cards, one for each beam element.

Column	1 - 10	11 - 20	21 - 30	31 - 45	36 - 40	41 - 45
Name	AR	XI	YJ	MAT	JTNR	JTFR

AR = area of beam cross section, in<sup>2</sup>

XI = moment of inertia of area, in<sup>4</sup>

YJ = effective torsional moment of inertia, in<sup>4</sup>

MAT = material code corresponding to one of the materials input under paragraph 4.1.3.

JTNR, JTFR = joint numbers at the ends of the beam element

#### 4.1.8 Triangular Plate Element Properties, format (E10.3, 5I5)

Input NPE number of cards, one for each triangular plate element.

Column	1 - 10	11 - 15	16 - 20	21 - 25	26 - 30	31 - 35
Name	PTH	MAT	JT1	JT2	JT3	NDX

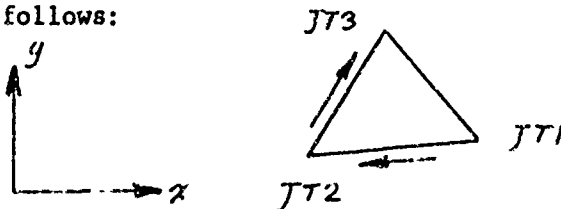

PTH = plate thickness, in.

MAT = material code corresponding to one of the materials input under paragraph 4.1.3

JT1, JT2, JT3 = joint numbers at the three corners of the triangular plate

Restrictions:

- a) The order of the joint numbers must be given in a clockwise manner as follows:

- b) The angle formed by the edges of the triangular plate at JT1 must not be 90°.

NDX = 0 the plate has isotropic properties and the flexural rigidity terms are computed from

$$DX = DY = \frac{YM(MAT) \times PTH^3}{12 \{ 1 - [PR(MAT)]^2 \}}$$

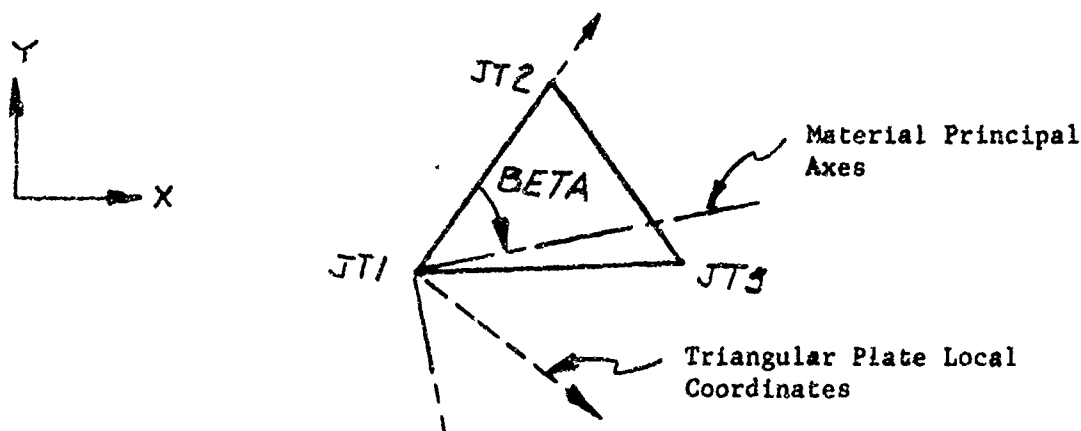

$$D1 = [PR(MAT)] \times DX$$

- = 1 the plate has orthotropic properties and the flexural rigidity terms are input by the next card [format (4E10.3)]

Column	1 - 10	11 - 20	21 - 30	31 - 40	41 - 50
Name	DX	DY	D1	DKY	BETA

DX, DY, D1, DKY = flexural rigidity terms, in.lb.

BETA = angle between material principal axes and the triangular plate local coordinates as shown below

#### 4.1.9 Option to Expand Reduced Flexibility Matrix

Note: The following card (NCOD) is always required at the end of all input data for any one particular case, whether or NOT the option is to be executed.

FORMAT (1I6)		
Column	1-6	
Name	NCOD	
Item	(1)	

NCOD = 0 Option not executed

= 1 Option executed

If NCOD = 1, the following card is required

FORMAT (3I8)			
Column	1-8	9-16	17-24
Name	NR	NNE	NWO
Item	(1)	(2)	(3)

NR = Number of boundary points used (1 or 2)

NNE = Mass number of first attach point

NWO = Mass number of second attach point, if NR = 2

NWO = 0 or left blank if NR = 1

To input more than one problem, the user need only repeat the cards in paragraph 4.1.1 through 4.1.8 for each additional problem.

#### 4.2 Description of Program Output

The program prints out all the input data for every problem followed by the solution consisting of the reduced upper right triangular stiffness (lb/in), flexibility (in/lb) and weight (lb) matrices as well as the modes and frequencies when these are requested on the card in paragraph 4.1.2. The stiffness, flexibility, and mass matrices that are printed/punched out only contain terms that are associated with the normal displacement "z". This is done so that when the flexibility matrix is used in subsequent collocation flutter analyses only the essential degrees of freedom are included in the flutter analyses. Also, the matrices are reduced to eliminate control points associated with fixed points (boundaries). If it is desirable to include the boundary points, it is only necessary to intersperse rows and columns of zero's at the proper place in the matrices. Immediately following the joint restraint information in the output, the program prints out the coordinate numbers assigned by the program to the normal displacements at each unrestrained joint. The elements in all the reduced output matrices are ordered according to these coordinate numbers.

In addition, the program punches out the entire flexibility and weight matrices row by row with the format (1P6E12.5) which is compatible with the input requirements of the Collocation Flutter Program. Each punched matrix is identified by a little card as the first card.

#### 4.3 Sample Problems

To illustrate the use of program FLUENCE, three sample problems are included in Appendix A. Each sample problem starts with a problem statement and is followed by a listing of the input data and the output of the program. The first sample problem is a simply supported uniform beam composed of five beam segments. The second is a uniform cantilever plate divided into 72 triangular plate elements, and the third is a lumped mass and beam network simulating a missile control surface.

#### 4.4 Processing Requirements

Program FLUENCE has been run on the GE-635 computer and it required about 31,000 cells of core storage. It is expected that the program storage requirement will be about the same on other digital computers. In addition to using the input and output files, 05 and 06, which are standard for the GE-635 computer, the program requires six other peripheral files, five of which are designated in the program by the numeric codes 07, 08, 19, 10 and 11, and the sixth is the card punch file.

There is no general formula for determining the run time required for a problem, but if a GE-635 computer is used, an estimate may be made from the times required for the three sample problems in Appendix A, which are as follows:

Sample Problem No.	No. of Joints	No. of Beam Elements	No. of Plate Elements	Consistent Masses Computed	Lumped Masses Input	No. of Modes & Freqs Computed	Run Time Hr.
1	6	5	0	Yes	No	4	0.0015
2	50	0	72	Yes	No	9	0.0691
3	29	45	0	No	Yes	9	0.0161

#### 4.5 Program Listing and Flow Chart

In the event future changes are needed in the program, a listing of the program is included in Appendix B. The program consists of a MAIN deck, 24 subroutines and one function subprogram. MAIN has the function of reading in data, numbering the coordinates (subroutine C00RDN), generating the codes for assembling the stiffness and weight matrices and calling the subroutines which develop the stiffness and mass terms for the beam and triangular plate elements. When the entire stiffness and weight matrices have been established for the whole structure, the MAIN program calls a subroutine which reduces these matrices as discussed before and determines the modes and frequencies as well.

The 24 subroutines and one function subprogram can be divided conveniently into five groups according to their function. The first group consists of those routines that develop the beam stiffness terms; these are TRANS and BEAMK. The second group consists of the routines which determine the beam mass terms; these are TRANS and BEAMM. The third group develops the triangular plate stiffness terms and these are PLATEK, CMAT, MINV, DINMAT, MATMPY, DMAT, DBLINT and PLYMP. The fourth group determines the triangular plate mass terms and these consist of PLATEM, CMAT, MINV, DINMTM, MATMPY, DBLINT and PLYMP. The fifth group of subroutines reduces the stiffness and

and mass matrices, finds the eigenvalues and eigenvectors and outputs the solution. This group is comprised of EIGEN, VIVID, ZRØMAK, ZRØMAM, SYMINV, EIGMAT, BIGMAT, LØØP1, LØØP2, LØØP3 and LØØP4.

Since the program listing is annotated extensively with comment statements, no further explanatory remarks are given here for the program. However, to facilitate the understanding of the interrelationships among the many subroutines, a flow chart of the entire FLUENC program is included in Appendix C.

$\frac{12EI}{L^3}$

EXCLUDED FROM

Sample Problem No. 3

Missile Control Surface Model  
(Modeled with beam elements and lumped weights)

Find first five natural modes and frequencies.

Note: Joint 11 is restrained from rotating about y

9      FORTRAN DECK
CEIGMAT
C      THIS SUBROUTINE FINDS THE EIGENVALUES AND EIGENVECTORS FOR
C      SYMMETRIC MASS AND STIFFNESS MATRICES.
C      THE ARGUMENTS ARE--
C      N- ORDER OF MATRICES.
C      A- DUMMY VECTOR WITH DIMENSION IN MAIN PROGRAM OF  $N*(N+1)/2$ 
C      VALU- STORAGE FOR EIGENVALUES. MUST BE DIMENSIONED IN THE MAIN
C            PROGRAM AS A VECTOR OF LENGTH NEIG.
C      TEMP,B,C,D,- DUMMY VECTORS WITH DIMENSION OF N IN MAIN PROGRAM.
C      F- DUMMY ARRAY WITH DIMENSIONS OF (N,3) IN MAIN PROGRAM.
C      IDUM- DUMMY INTEGER VECTOR WITH DIMENSION OF N IN MAIN PROGRAM.
C      MTAPE- TAPE WHERE STIFFNESS MATRIX IS STORED IN COMPACT FORM.
C      NTAPE- TAPE WHERE MASS MATRIX IS STORED IN COMPACT FORM.
C      JTAPE,ITAPE- SCRATCH TAPES.
C      NEIG- NUMBER OF EIGENVALUES DESIRED.
C      NVEC- NUMBER OF EIGENVECTORS DESIRED. MUST BE EQUAL TO OR LESS
C            THAN NEIG.
C      THE MASS AND STIFFNESS MATRICES ARE STORED IN COMPACT FORM AS
C      VECTORS. ONLY THE UPPER TRIANGLE OF THESE MATRICES(BY ROWS) IS
C      STORED.

# EIGMAT

THIS SUBROUTINE FINDS THE EIGENVALUES AND EIGENVECTORS FOR  
SYMMETRIC MASS AND STIFFNESS MATRICES.

THE ARGUMENTS ARE--

N- ORDER OF MATRICES.

A- DUMMY VECTOR WITH DIMENSION IN MAIN PROGRAM OF  $N*(N+1)/2$

VALU- STORAGE FOR EIGENVALUES MUST BE DIMENSIONED IN THE MAIN  
PROGRAM AS A VECTOR OF LENGTH NEIG.

TEMP,B,C,D,- DUMMY VECTORS WITH DIMENSION OF N IN MAIN PROGRAM.

E- DUMMY ARRAY WITH DIMENSIONS OF (N,3) IN MAIN PROGRAM.

IDUM- DUMMY INTEGER VECTOR WITH DIMENSION OF N IN MAIN PROGRAM.

MTAPE- TAPE WHERE STIFFNESS MATRIX IS STORED IN COMPACT FORM.

MAAPE- TAPE WHERE MASS MATRIX IS STORED IN COMPACT FORM.

ITAPE,ITAPE- SCRATCH TAPES.

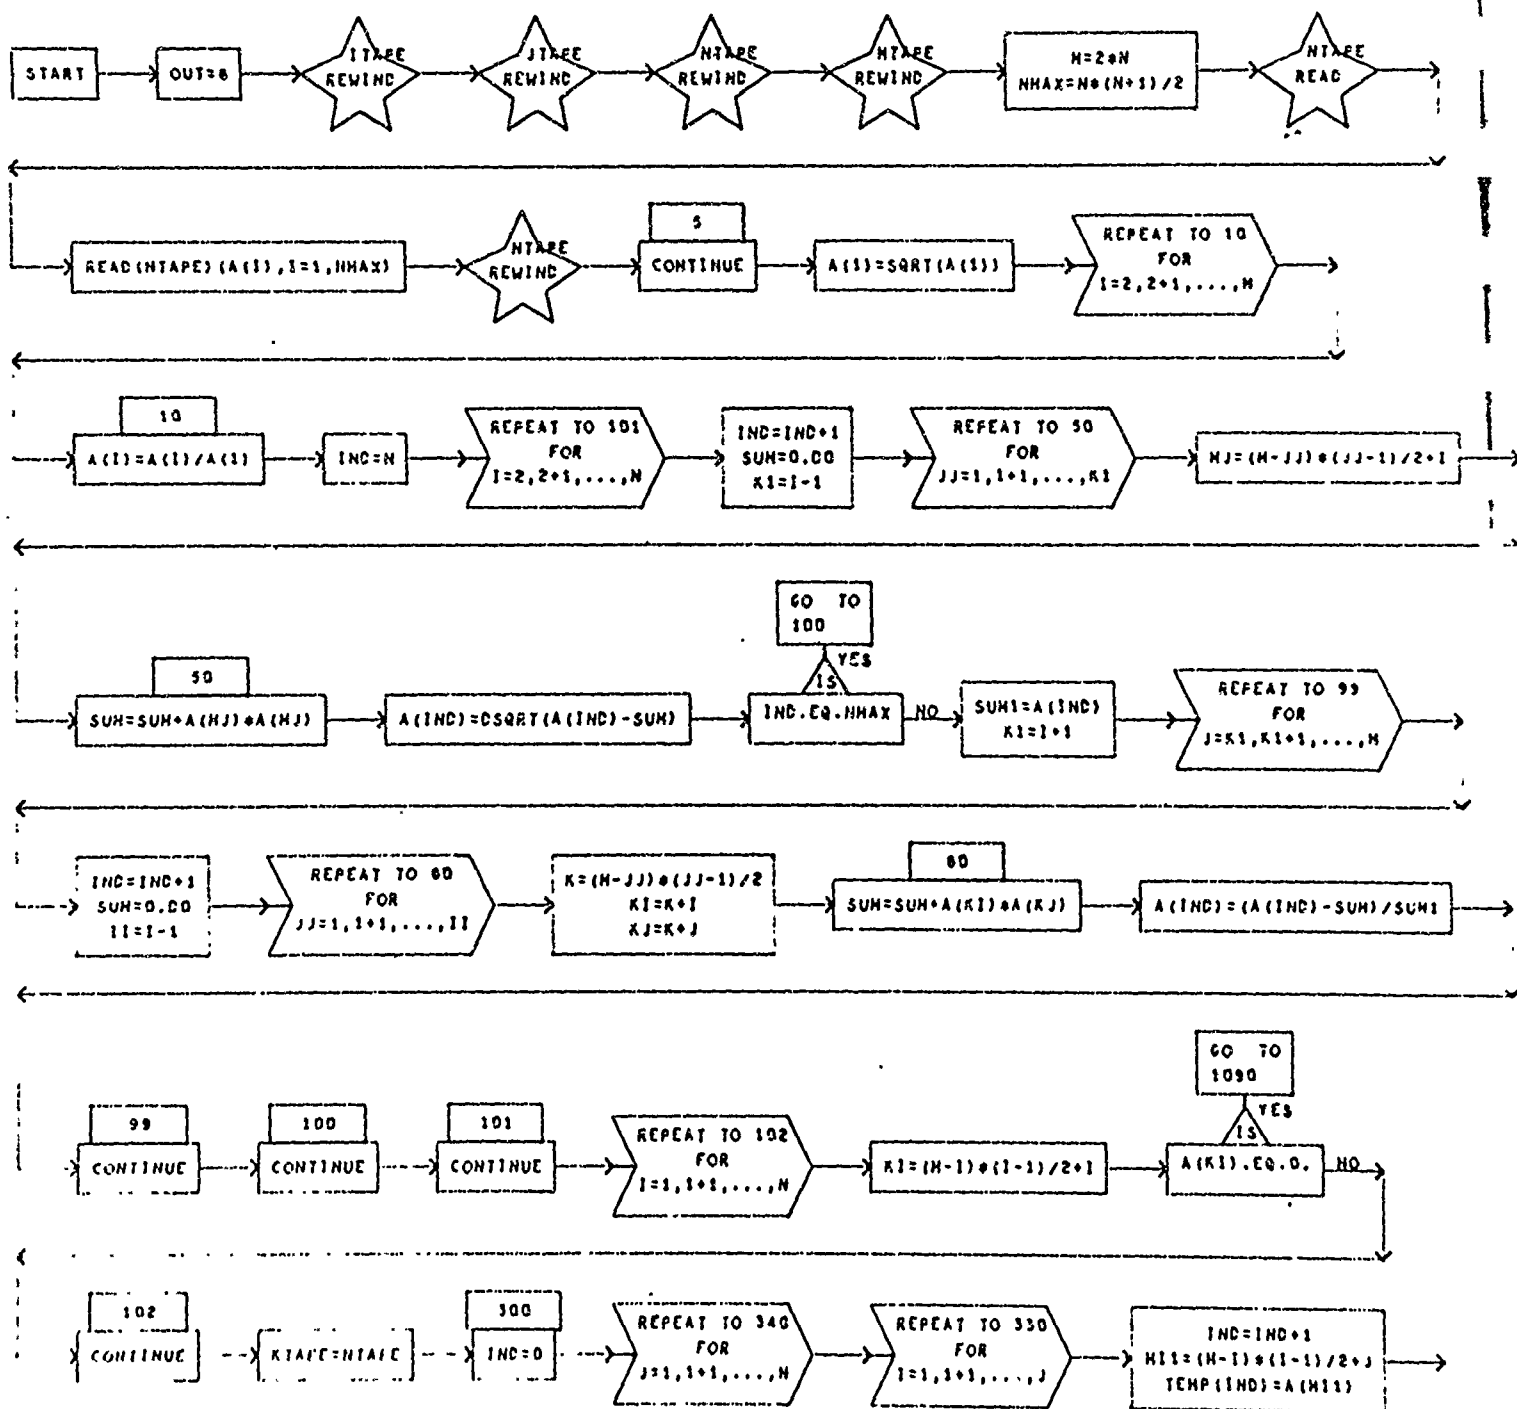

NEIG- NUMBER OF EIGENVALUES DESIRED.

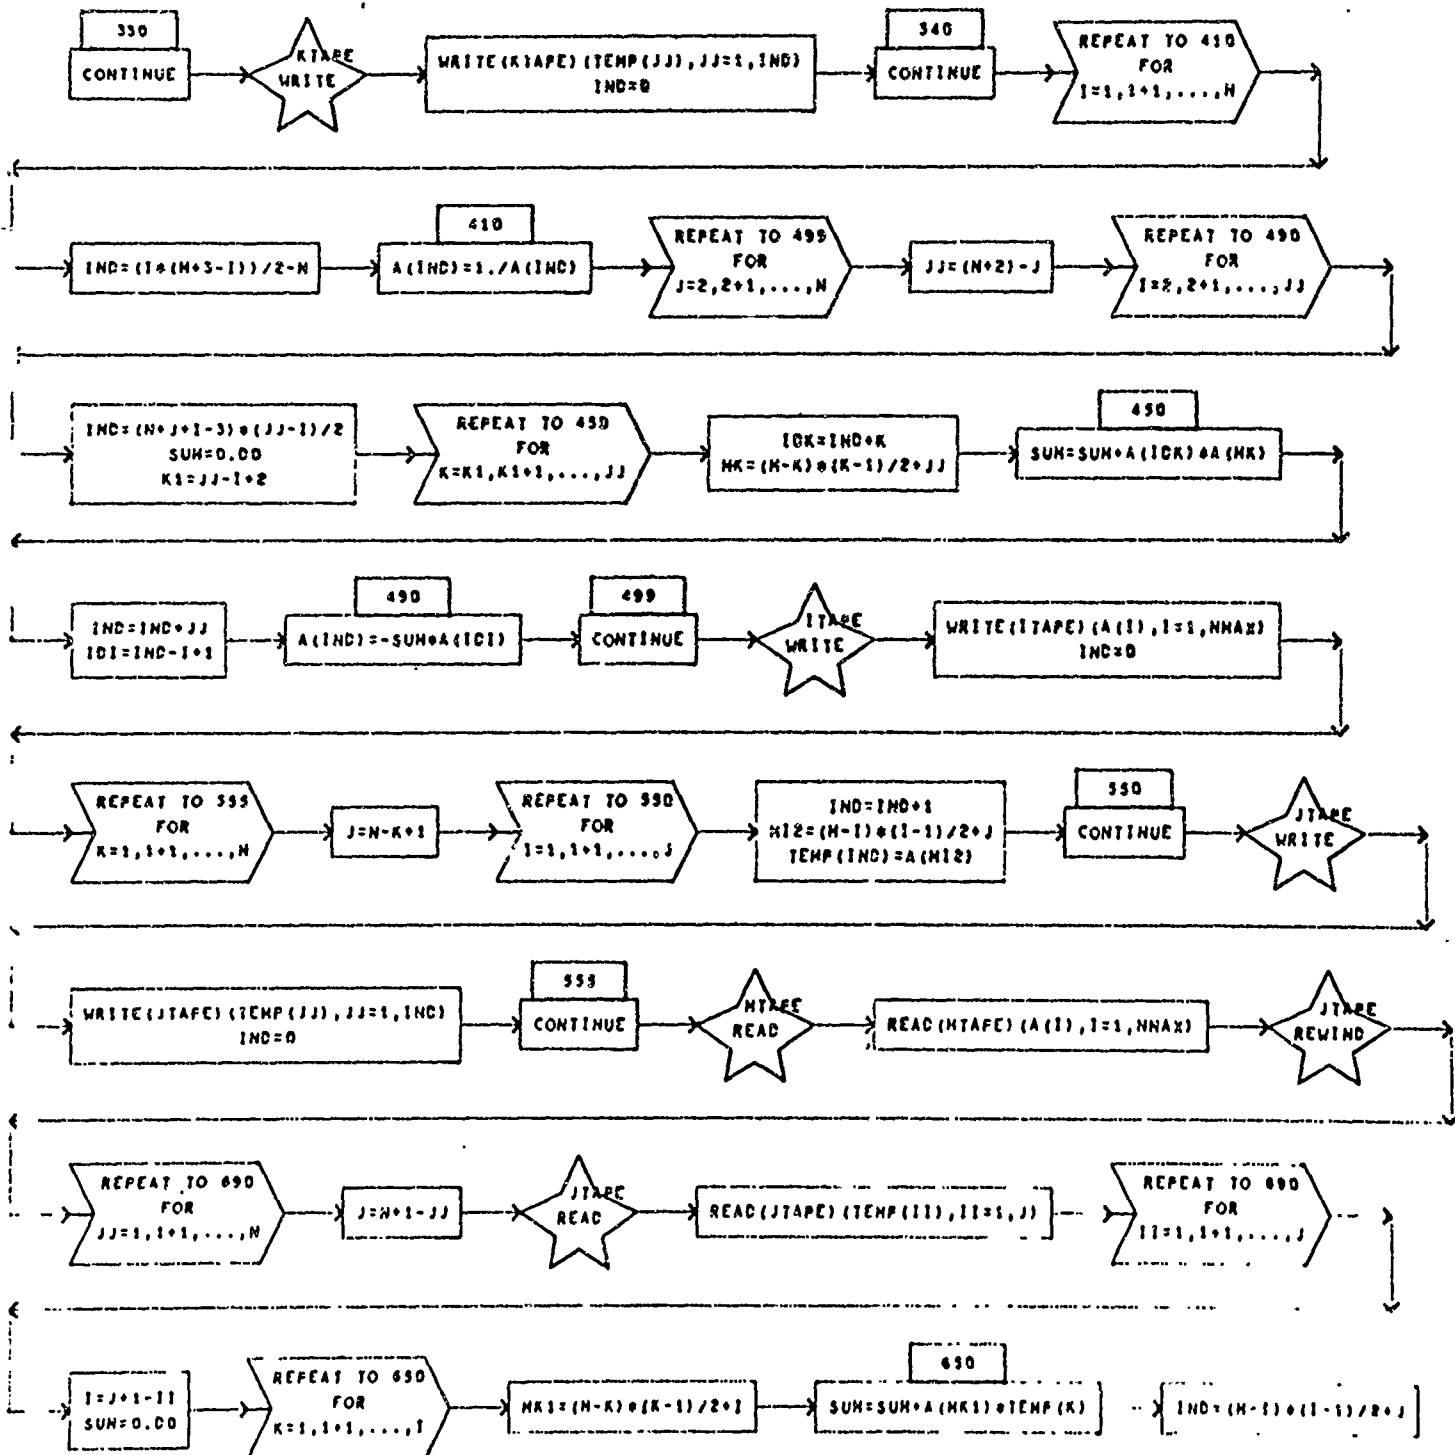

NVEC- NUMBER OF EIGENVECTORS DESIRED. MUST BE EQUAL TO OR LESS  
THAN NEIG.

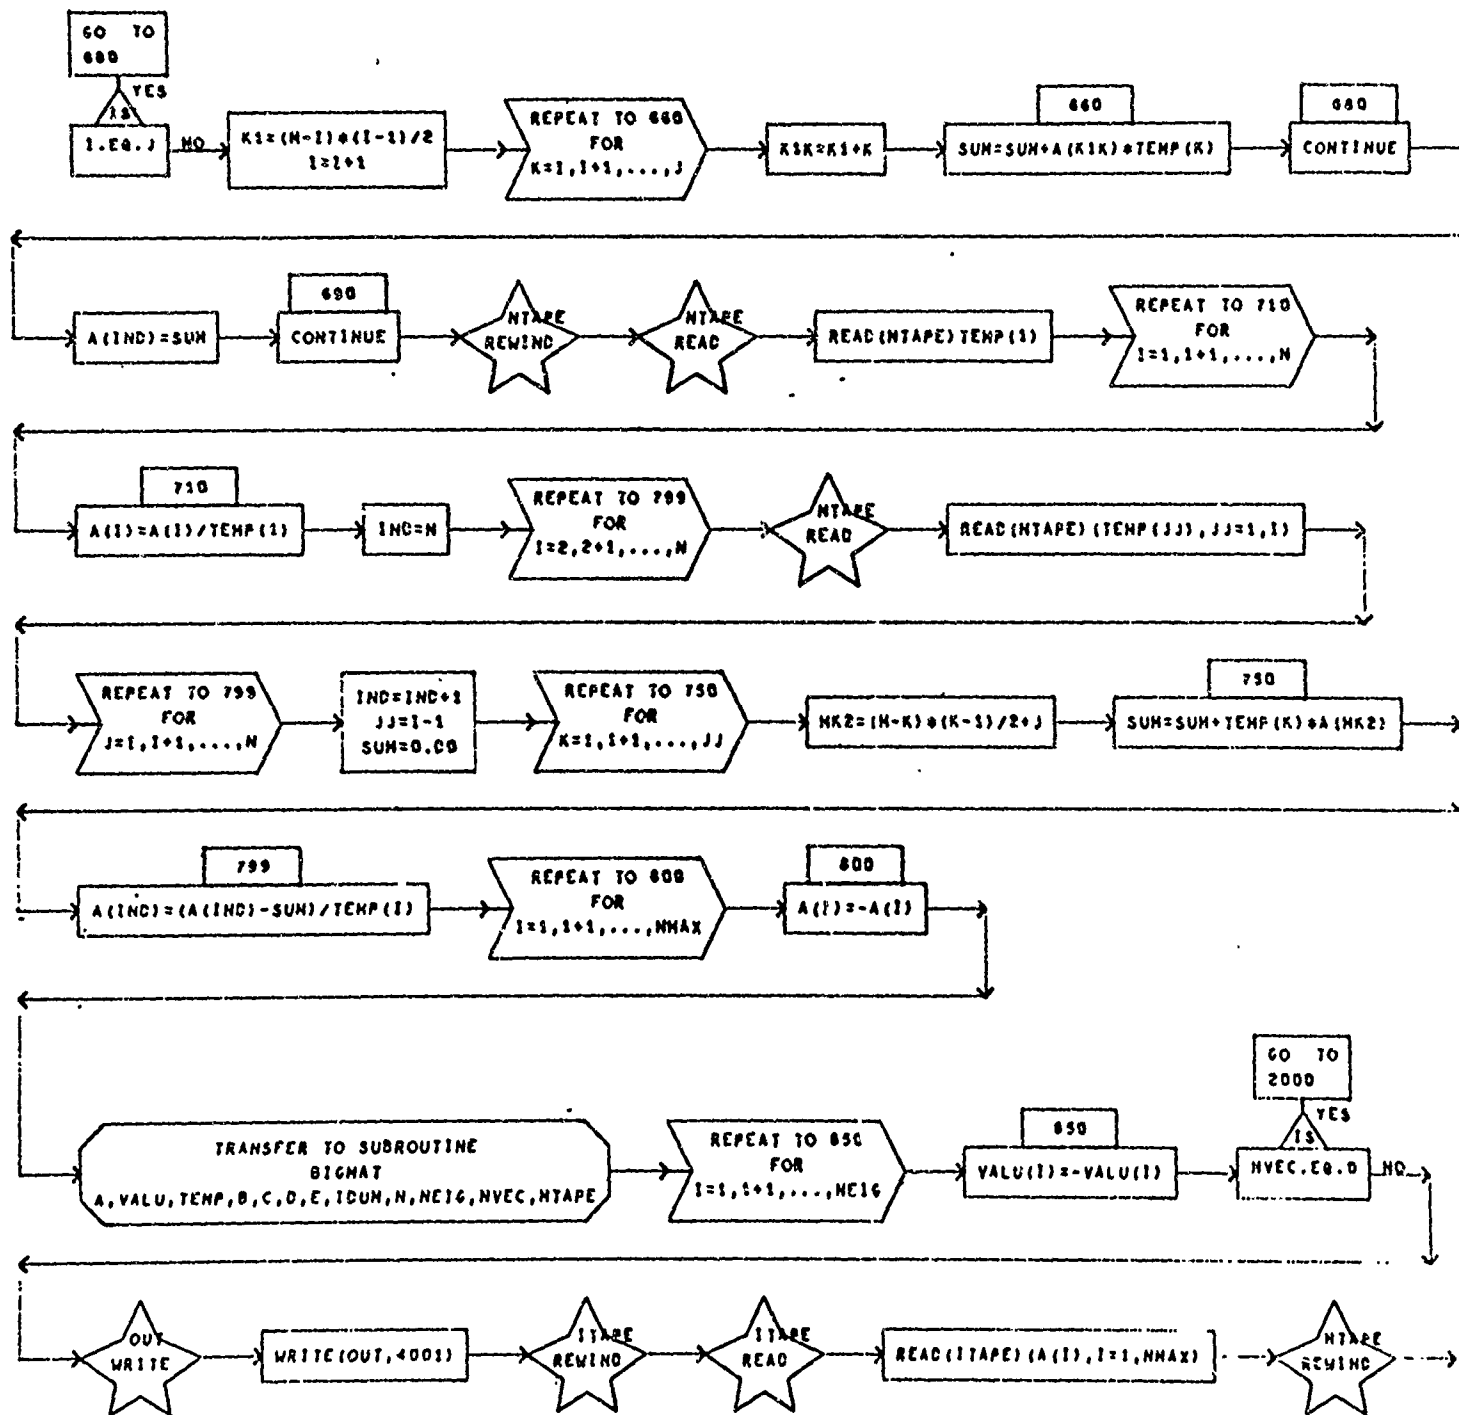

THE MASS AND STIFFNESS MATRICES ARE STORED IN COMPACT FORM AS  
VECTORS. ONLY THE UPPER TRIANGLE OF THESE MATRICES(BY ROWS) IS  
STORED.

13. ABSTRACT  THIS STUDY COVERS THE DEVELOPMENT OF A SET OF COMPUTER PROGRAM TO PERFORM FLUTTER ANALYSIS BY THE COLLOCATION METHOD. WHILE THIS METHOD HAS BEEN KNOWN FOR SOME TIME, ONLY RECENTLY HAVE ADVANCES IN COMPUTER TECHNOLOGY MADE THE METHOD TECHNICALLY AND FINANCIALLY FEASIBLE. THE INGREDIENTS OF A COLLOCATION FLUTTER ANALYSIS ARE 1) A FLEXIBILITY MATRIX, 2) AERODYNAMIC INFLUENCE COEFFICIENT MATRIX, AND 3) AN EIGENVALUE SOLUTION. THIS STUDY IS PRESENTED IN FOUR VOLUMES. VOLUME I CONTAINS A GENERAL PROGRAM DISCUSSION. VOLUME II CONTAINS THE PROGRAM FLUENC WHICH CALCULATES THE FLEXIBILITY MATRIX. VOLUME III CONTAINS A SET OF THREE PROGRAMS TO CALCULATE AERODYNAMIC INFLUENCE COEFFICIENTS FOR SUBSONIC, TRANSONIC, AND SUPERSONIC FLIGHT REGIMES. VOLUME IV CONTAINS THE PROGRAM COMA WHICH SETS UP AND SOLVES THE FLUTTER EIGENVALUE MATRIX.
